

Self evaluation – Week 7 – Wincent

I acted as the simulated SCRUM master this sprint. The focus of this week was to finish the technical part of the project. Last week we failed to follow the INVEST guidelines for the user stories, and the main focus of this week's planning was to set that right and make better user stories and tasks this week. As the SCRUM master I made sure the tasks we created followed the guidelines as best they could.

We again this week divided the group into two sub-groups focused on different things. One group to polish up the front end of the application, and the other to finish the routing algorithm. As a developer I mostly followed the final stretch of the routing algorithm. I believe we managed much better this sprint than the last, something echoed by the other group members.

I am happy with what we managed to deliver, and believe the product shows promise and could have been developed further had time allowed. In the sprint review we talked a bit about keeping the hosted version up and buying a domain, to preserve it for some time to allow everyone to show it off as an entry in future job searching.

The KPIs I put together this week followed the trend of the last few weeks, with them looking more like a waterfall. The KPIs assume that the work week is evenly distributed, but that is not the reality of our time spent on the project. Still we now have the final set of KPI graphs which shall be presented.
