

Oscar Marrero Engström

As with all weeks so far, at the start of this week's sprint we met with Mazen for a supervision session. We explained to Mazen how last week's sprint was not the success we had hoped for, while also laying out a plan for how we would try to circumvent this moving forward. Mazen seemed happy with our plan and also told us that at some point he expected us to encounter some resistance.

After the meeting we started planning our sprint and this time around we really focused on developing tasks complying with the INVEST criteria. This is something we discussed as a team during our last sprint review, and everyone felt that we needed to focus on this particular aspect of the sprint planning for this week. I personally felt that everyone made a great effort in trying to achieve this, because after our sprint planning our backlog was filled with concrete and independent tasks that everyone on the team could take on and tackle throughout the sprint.

For this sprint my main focus was implementing some redesign choices in the front-end of our application. I spent quite some time troubleshooting simple errors in JavaScript since it's still not my most used programming language. But I felt that I made good progress throughout the sprint and managed to deliver the tasks that I took upon myself to complete.

Another aspect I think the team excelled in this week was how the planning allowed us to work separately and towards the end of the sprint merge all of our contributions. We achieved this in a more or less seamless manner which was really great for everyone, and it showed in the roundtable we held during this week's sprint review. A feeling all team members echoed was that they felt this sprint had a much better outcome than the previous one, which was one of my personal goals for this week: trying to make the feeling at the end of the sprint better than what it was during the previous week.

Looking forward there is not a lot left to do in terms of development. We are, if not already there, very close to reaching a minimal viable product that everyone can feel content with. Some minor adjustments can of course always be implemented, but our focus should now shift from trying to perfect our product to other aspects of the course. During the next sprint we will showcase our product to other teams in a presentation, and I feel that I could contribute to make this presentation valuable for us. During the next sprint we will also start to write our final report for the course and make some final adjustments in our repository before it is retired. These are all aspects that I feel I can help my team on by working on gathering documentation to be uploaded to our repository, starting to consider answers to the questions we will face in the final report and by organizing our repository into what will be its final state.
