

Individual reflections - Isak week 5

This week was a little more exciting for my part, as I was the scrum master. As the scrum master I took the main responsibility of creating tasks for the user stories for this week and had an oversight of the workflow. I noted what had been achieved for each day and wrote the number of tasks done and effort delivered into our excel sheet for our KPI:s. I assigned everyone to the user stories that they would work on for this sprint and it seemed like everyone was happy with my decisions and general administration. I found it really exciting and fun to be scrum master and would absolutely be open to doing it again. I would like to try being scrum master for more than one sprint, as I feel that know you were barely able to get used to it before your turn was over. But still I found it fun to be the one making sure that the groups workflow went on without problems.

This week the team was very efficient and I think that we all were very pleased with what we achieved. Me and Rasmus worked mainly on the current route page and made it possible to show data for the route that the user is walking. I also added a dummy map which was later replaced with the map that we will actually use. Even though the map I added only was temporary, used to make the others understand the layout of the webpage, it still was a good exercise. It helped me understand more parts of the project and will help me in the future sprints if someone needs help with maps or if I get assigned a user story relating to maps.

I finished my assigned tasks a little quicker than planned and had time over this sprint, so I could help Marcus with the map api. I found a potential plugin that could be used, but we decided that it was not needed. I also helped Rasmus as our tasks belonged to the same user stories and we therefore had a good grasp of what the other was doing and how we could help each other. The fact that I had time over probably means that we could get even better at doing effort estimations for our stories, but I think that we improved from last week. SO hopefully we will improve on that even more for next week, but I think that effort estimations can be something that a team never fully gets right, no matter how many years they have worked together. But I think that we still can manage to improve regarding that.
