

Individual reflections - Isak week 7

This week was a lot better than last week regarding me and my group's use of scrum. We planned ahead and made more concrete user stories with more concrete tasks. We also split up into two groups since the last sprint where the whole group ended up working on the route generation resulted in a lot of repeated work. I was one of those that started working on other aspects of our application than the route generation. We looked over what we would want to polish and maybe add as extra features. I did some work on our new route page, redesigning our buttons for choosing of terrain, and also added a gif for the loading page which gives some customer value since it makes the page look responsive in the way that it doesn't give the impression that it has frozen. I also, as did my other teammates, tested our website more extensively than before to find bugs or weird behavior.

I feel that this sprint felt better and more rewarding than the last sprint, since I could work on stuff that I felt mattered for the application and that my instructions on what to do were more clear. We tried to adhere to the INVEST way of thinking when creating our tasks and that really showed. I feel that I could contribute more to the team and even had time to test the route generation and give feedback to the part of the team that worked with the generator. I also feel that I really contributed to the team's weekly reflection, especially the part where we discussed documentation.

This sprint was the last sprint where we focused on our application. Next sprint will be more focused on our last deliverables. I want to feel like an important part when writing our teams final reflection, and to be that I have to start as soon as possible to collect my thoughts, read through the earlier team reflections and once again look over the course material. If I do this I feel that I can really contribute to the final reflection, something I obviously want to do since I want to be a good teammate.
